As the Executive Committee, on behalf of the Program Committee and Organizing Committee, we would like to warmly welcome you to the 2019 International Joint Conference on Neural Networks (IJCNN 2019) in Budapest, Hungary. We would like to thank the leadership of the International Neural Network Society (INNS), in cooperation with the IEEE Computational Intelligence Society (IEEE-CIS) societies for their support and encouragement, especially the presidents Irwin King and Nikhil R. Pal. In IJCNN 2019 we received 1532 submissions from 82 countries, 30 of which were later withdrawn. Of these, 803 papers (52.4%) were accepted. The conference features 558 oral presentations and 245 poster presentations. The program also features 9 plenary talks, 3 panels, 11 tutorials, 4 workshops, 34 special sessions, and 4 competitions. The plenary talks by Isabelle Guyon, C. Lee Giles, Věra Kůrková, Erkki Oja, Adam Miklósi, Nikola Kasabov, Danil Prokhorov, Wolf Singer and Ichiro Tsuda reflect the diverse themes of neural network applications, recurrent neural network, deep and shallow neural networks, unsupervised learning, robotics, spiking neural network architectures, neural networks in the automotive industry, and mathematical point of view of neural networks of memory, and its dynamics.

The program includes a broad coverage of topics in the general area of neural networks, with a strong showing of trendy topics such as deep neural networks. The three panels on funding opportunities for neural networks research, NSF Career Award winners and Deep Learning: Hype or Hallelujah? are expected to provide insights and vision of the future for the field of neural networks.

Organizing a conference of this scale and diversity is not possible without the dedicated service by our colleagues. We are especially indebted to the Program Co-Chairs Plamen Angelov and Manuel Roveri and the Technical Program Co-Chairs, Khan Iftekharuddin and Dongbin Zhao for their timely and professional help with all matters relating to the program. We would also like to thank the Plenary Chair Richard Duro; Publication Chairs Chul Sung, Sponsors and Exhibit Chair: Bill Howell; Panels Chair Robert Kozma; Honorary and Award Chair: Péter Érdi; Publicity Co-Chairs Hava Siegelmann, Jose Antonio Iglesias Martinez and Simone Scardapane; Tutorials Chair Simona Doboli; Special Sessions Chair Danilo Mandic; Competition Chair Hugo Jair Escalante Balderas; Web Reviews Chair Tomasz Cholewo; Regional and Topical Liaisons Irwin King, Thomas Trappenberg, Jaouad Boumhidi, Marley Vellasco, Mahua Bhattacharya, Zoltan Nadasdy, Robi Poikar, Angelo Cangelosi, Danil Prokhorov; Local Arrangements Co-Chairs George Kampis, Andrs Telcs and Jennifer Csatos, Doctoral Consortium Chair Liwicki Marcus. We are extremely grateful to all the program and technical committee members who helped us with the review of a record number of papers submitted this year, and all the reviewers who turned in thoughtful and meaningful reviews for the assigned papers. Foremost, we would like to thank all of the authors, especially student authors, who worked so hard on their research and took extreme effort to write up and submit their papers. Without such high quality, high impact papers, the continuing success of IJCNN would not have been possible.

We are also very grateful of the INNS Board of Governors for their support and advice, especially the past INNS presidents Robert Kozma and Danil Prokhorov, and Yoonsuck Choe who has supported the organization of IJCNN 2019 with relaying his knowledge and experience of organising the previous edition of IJCNN conference. Finally, we would like to thank the following sponsors for their generous support: Silver sponsor Budapest Semester in Cognitive Science; and Bronze sponsors Genisama and MDPI. We also thank IEEE-CIS for providing generous travel support for student authors and attendees.

We wish you have a stimulating, inspiring and informative experience at IJCNN 2019.

1.2 Welcome Message from the President of INNS

I am delighted to welcome all the participants to International Joint Conference on Neural Network (IJCNN) 2019 in Budapest. IJCNN conference series is the premier conference in the field of neural networks and is the flagship conference of the International Neural Network Society (INNS). This conference is jointly sponsored by INNS and the IEEE Computational Intelligence Society (CIS), with proceedings published by IEEE Press. INNS has contributed significantly to the organization of IJCNN 2019.

We are in an exciting time in the field of neural networks. This year we have received a record number of submissions and accepted high quality papers for presentations. With also a record of registrations, IJCNN 2019 will no doubt be an event to learn about the latest research results and achievements, but also a place to connect with old friends and make new ones.

I would also like to take this opportunity to highlight some of the pioneers and giants in the field for the annual award this year. Specifically I would like to congratulate this year's five recipients: Stephen Grossberg for the Donald O. Hebb Award recognizing his outstanding achievements in biological learning, Bernard Baars for the Hermann von Helmholtz Award recognizing his outstanding achievements in perception, Danilo Mandic for the Dennis Gabor Award recognizing his outstanding achievements in neural engineering, Don Wunsch for the Ada Lovelace Service Award recognizing his meritorious service to the neural community, and Zhen Ni & Aharon Katzir for the Young Investigator Award as most promising young investigators in the field of neural networks. It is my hope that these awards will not only highlight the great achievements from each individual, but will also inspire potential future award recipients to achieve great heights.

I would also like to express my gratitude to the IJCNN 2019 organizing team led by Chrisina Jayne, Zoltán Somogyvári, Plamen Angelov, and Manuel Roveri for their great efforts in the organization of the conference. I would also like to thank our Technical Program Co-chairs: Khan Iftakharuddin and Dongbin Zhao for overseeing the review process and creating a strong technical program. I am also grateful to our keynote speakers: Isabelle Guyon, C. Lee Giles, Věra Kůrková, Erkki Oja, Adam Miklósi, Nikola Kasabov, Danil Prokhorov, Wolf Singer, and Ichiro Tsuda for enriching the technical program with their outstanding achievements.

INNS has always been an international, interdisciplinary, and inclusive society that has a tradition of mutually beneficial collaborations with sister organizations such as the Asian-Pacific Neural Network Society (APNNS), European Neural Network Society (ENNS), Japanese Neural Network Society (JNNS), and other regional and national organizations and chapters. Our flagship journal "Neural Networks" is published through our partnership with Elsevier, and it is one of the leading journals in neural network research. Moreover, I would like to highlight a few key areas that INNS is now focusing with the support from the Board of Governors. First, we have formally created the Industry Advisory Board (IAB) under the leadership of Asim Roy to provide INNS members opportunities to interact with key players in the industry. IAB would provide valuable industry insights, knowledgeable guidance, and more to INNS and her members. Second, we are focusing on our student members in a big way by providing more student travel grants and by creating the inaugural INNS Doctoral Dissertation Award this year to encourage and inspire future leaders in the field. Third, we are actively developing policies on codes of ethics and professional conducts in order to better fulfill our mission and vision with excellence in the years to come. These are exciting developments and I hope that your active participation will make these initiatives a great success.

Last but not least, I wish you a productive and fruitful IJCNN 2019, and I look forward to meeting you in Budapest.

Sincerely,

Irwin King
President of INNS

1.3 Welcome Message from the President of IEEE-CIS

As the President of the IEEE Computational Intelligence Society (CIS), I take immense pride and pleasure to welcome all the delegates to this great event, the 2019 International Joint Conference on Neural Networks (IJCNN), July 14-19, 2019, Budapest, Hungary. The IEEE CIS and the International Neural Networks Society (INNS) have been jointly organizing IJCNN for many years. You may be aware that in even years the IJCNN is organized as a part of the IEEE World Congress on Computational Intelligence (WCCI). The 2020 edition of the IJCNN will be held as a part of WCCI 2020, July 19-24, 2020, Glasgow, UK (<https://wcci2020.org/>).

A quick look at the technical program of IJCNN 2019 reveals that like any other previous editions of IJCNN, this year too it has a packed program including tutorials, special sessions, and plenary talks. The technical program covers almost all facets of neural networks and related learning systems including supervised learning, unsupervised learning, reinforcement learning, convolutional neural networks, spiking neural networks, cognitive algorithms, and deep learning along with a wide spectrum of applications. People call this era as the era of Artificial Intelligence (AI). And one of the key components in realizing some of the most successful AI systems is deep neural networks. Consequently, as one would expect, there are many sessions focused on various aspects of deep learning. Since its inception, IJCNN has been playing a leading role in promoting and facilitating interaction among researchers and practitioners, and dissemination of knowledge in neural networks and related facets of machine learning. And I know, this year will be no exception. In spite of huge success of neural networks and other machine learning tools in solving many difficult problems, there remain a few issues of concern such as lack of interpretable models and explainable AI. I am happy to see that there are several papers that focus on these issues. Explainable AI is an area where we need a significant research effort and I hope the interaction during IJCNN will help us in addressing these problems. With the recent renewed interest in AI primarily caused by deep learning, I have no doubt that IJCNN will continue to grow and maintain its presence as a prominent platform for exchange of knowledge in machine learning and artificial intelligence.

In order to come up with such a rich technical program, we need huge amount of work. I take this opportunity to express my sincere gratitude to every member of the organizing committee, program committee, in particular to program chairs, and also to the reviewers for their sincere efforts. Thank you for your outstanding work. But no conference would become a conference without the authors who provide the technical input to the conference. I sincerely thank all of the authors who submitted their research contributions to the conference. The last but certainly not the least, I sincerely express my gratitude to the volunteers of both CIS and INNS, who have worked synergistically to make this event happen. I wish all of you to have a wonderful conference. I am sure you will have great time both academically and otherwise. Before I conclude, on behalf of the IEEE CIS, I extend a warm invitation to all of you to the WCCI 2020 in Glasgow.

7.1 Isabelle Guyon

- IRI France
- Title: Neural network solvers for power transmission problems
- Transporting electricity across states, countries, or continents is vital to modern societies. We take for granted that electricity is available to use at all time, but reliably managing power grids and in particular avoiding "blackouts" (catastrophic cascading failures) is a difficult problem requiring skilled engineer controlling operation at all times. With the advent of renewable energies and the globalization of electricity markets, the problem is increasing in complexity. In this context, there are opportunities for neural networks and machine learning methods to help automating the system. The contributions of neural networks can range from replacing existing physical simulators of the grid by faster neural network proxies, to suggesting preventive or curative actions to protect lines from over-heating, by rebalancing the flow in the power grid. The latter problem may be amenable to reinforcement learning. We will compare two neural network approaches that we developed to speed up power flow computations. The first one, the LEAP net (LatentEncoding of Atypical Perturbation) implements a form of transfer learning, permitting to train on a few source domains (grid topology perturbations), then generalize to new target domains (combinations of perturbations), without learning on any example of that domain. We evaluate the viability of this technique to rapidly assess curative actions that human operators take in emergency situations, using real historical data, from the French high voltage power grid. The second one, the Graph Neural Solver (GNS) overcomes the limitation of the LEAP net to work in the vicinity of a fixed grid topology by implementing an iterative approximation of the physics equations. Finally, to go beyond the simple prediction of flows and move towards assisting operators to control the grid, we present the competition program "learning to run a power network", of which a first edition ran this year as part of the IJCNN competition program.

- Title: Recurrent Neural Networks: Automata and Grammars
- Neural networks are often considered to be black box models. However, discrete time recurrent neural networks (RNNs), which are one of the most commonly used, have properties that lend themselves to similarities with automata and formal grammars and thus to the extraction and insertion of grammar rules. Assume that we have a discrete time RNN that has been trained on sequential data. For each discrete step in time, or a collection thereof, an input can be associated with the RNNs current and previous activations. We can then cluster these activations into states to obtain a previous state to current state transition that is governed by an input. From a formal grammar perspective, these state-to-state transitions can be considered to be production rules. Once the rules are extracted, a minimal unique set of states can be readily obtained. It can be shown that, for learning known production rules of regular

grammars, the rules extracted are stable and independent of initial conditions and, at times, outperform the trained source neural network in terms of classification accuracy. Theoretical work has also shown that regular expression production rules can be easily inserted into certain types of RNNs and proved that the resulting systems are stable. Since for many problem areas such as finance, medicine, security, etc., black box models are not acceptable, the methods discussed here have the potential to uncover what the trained RNN is doing from a regular grammar and finite state machine perspective. We will discuss the strengths, weaknesses, and issues associated with using these and associated methods and applications such as verification.

7.3 Věra Kůrková

- Institute of Computer Science of the Czech Academy of Sciences
- Title: Limitations of Shallow Networks
- Although originally biologically inspired neural networks were introduced as multilayer computational models, shallow networks have been dominant in applications till the recent renewal of interest in deep architectures. Experimental evidence and successful applications of deep networks pose theoretical questions asking: When and why are deep networks better than shallow ones?

This lecture will present recent mathematical results describing high-dimensional tasks which either cannot be computed by reasonably sparse shallow networks or their computation is unstable. As minimization of the number of units in a shallow network is a hard nonconvex problem, we will focus on approximate measures of network sparsity defined in terms of suitable norms. We will show how geometrical properties of high-dimensional spaces imply lower bounds on network complexity. The bounds depend on sizes and covering numbers of dictionaries of computational units. Combining the general results with estimates of sizes of common dictionaries, we will derive large lower bounds on complexity of shallow networks needed for computation of almost any function on a sufficiently large domain. We will also consider non uniform distributions modeling relevance of computational tasks and derive consequences for choices of dictionaries of computational units suitable for efficient computation. To complement probabilistic results by constructive ones, we will present classes of functions built using Hadamard matrices and pseudo-noise sequences. We will use them to obtain examples of functions which can be computed by two-hidden-layer perceptron networks of considerably smaller model complexities than by networks with one hidden layer. Finally, we will discuss connections with the No Free Lunch Theorem and the central paradox of coding theory.

7.4 Erkki Oja

- Aalto University, Finland
- Title: Forty Years of Unsupervised Machine Learning
- Unsupervised learning is a classical approach in artificial neural networks, pattern recognition and data analysis. Its importance is growing today, due to the increasing data volumes and the difficulty of obtaining labelled training data of sufficient quantity and quality, that could be used for supervised learning. The talk looks at the basic approaches during the past forty years, especially from the perspective of neural networks and machine learning. A widely used methodology are linear latent variable models, such as principal component analysis, independent component analysis, and nonnegative matrix factorizations. All can be presented as decompositions of the data matrix containing the unlabeled samples. Another widely used classical methodology is clustering, which also has a relation to matrix factorizations. In self-organizing maps, the clusters are ordered in a specific way. In deep learning, nonlinear latent variables can be found by autoencoders. Lately, using unsupervised adversarial networks for image synthesis has gained popularity.

7.5 Adam Miklósi

- Eötvös Loránd University, Budapest
- Title: Ethorobotics as an emerging discipline for building better social agents

- Ethology is the biological study of animal behaviour, including humans. In recent years, social robotics aims to build autonomous agents that co-habit with humans in various social groups at the work place, hospitals or homes for elderly. Thus it is time to establish a new interdisciplinary approach that relies on more than 100 years of biological knowledge on animal behaviour and facilitates the construction of hardware and software for social robots.

Thus ethorobotics is defined as the science of applying animal social behavioural rules for the design of social robots interacting with living beings (animals or humans). This means that ethorobotics has strong roots in biology, looking at the function of the behaviour and considers often the embodiment (shape and form) rather as a consequence of achieving the best performance under given conditions.

The key example for ethorobotics is the family dog that has a long history of domestication, and proved to be very successful in human communities during the last 20-30 thousand years, despite being rather different in shape and also in behavioural and cognitive performance in comparison to humans.

After studying human-dog interaction for many years, we came to the conclusion that this relationship could provide a very good initial model for human-robot interaction. We consider the dog to be mans first biorobot. Thus we suggest that social robots of the future should be by no means similar to man but represent a "new species".

We aim to present evidence how ethorobotics could promote building better social robots. Based on the detailed study of the behavioural aspects of human-dog relationship, we can make proposals for the behavioural capacities of social robots. These would include social skills, like attachment, faithfulness, emotional responsiveness, social monitoring.

7.6 Nikola Kasabov

- Auckland University of Technology, Auckland, New Zealand; Advisory/Visiting Professor: Shanghai Jiao Tong University, Robert Gordon University UK
- Title: Deep Learning and Deep Knowledge Representation of Time-Space Data in Brain-Inspired Spiking Neural Network Architectures
- The talk argues and demonstrates that the third generation of artificial neural networks, the spiking neural networks (SNN), can be used to design brain-inspired architectures that are not only capable of deep learning of temporal or spatio-temporal data, but also enabling the extraction of deep knowledge representation from the learned data. Similarly to how the brain learns time-space data, these SNN models do not need to be restricted in number of layers, neurons in each layer, etc. as it is the case with the traditional deep neural network architectures. The presented approach is illustrated on an exemplar SNN architecture NeuCube (free software and open source available from www.kedri.aut.ac.nz/neucube) and case studies of brain and environmental data modelling and knowledge representation using incremental and transfer learning algorithms These include predictive modelling of EEG and fMRI data measuring cognitive processes and response to treatment, AD prediction, BCI, human-human and human-VR communication and other. More details can be found in the recent book: Time-Space, Spiking Neural Networks and Brain-Inspired Artificial Intelligence, Springer,2019, <https://www.springer.com/gp/book/9783662577134>.

7.7 Danil Prokhorov

- Toyota R&D Institute
- Title: Machine learning in the automotive world: from powertrains to autonomous vehicles and beyond
- Machine learning in general and artificial neural networks in particular have always been a fascinating area of automotive R&D. Perhaps, this fascination is a reflection of a great contrast between traditionally slow advancements in a very conservative, regulated business in which costs of hardware dominate and rapid growth of software/high tech, which increasingly become the key in driving innovative automotive solutions. It is indeed appealing to be able to design and deploy systems with properties which may change radically without hardware changes, reprogramming or reconfiguring them by software instead.

Powertrain applications of machine learning continue to be few and far between due to legacy issues. In contrast, autonomous driving applications of machine learning promise to break with this tradition by introducing the major new technology as essentially an add-on to existing vehicles. I overview machine learning R&D for automotive applications over the past 20 years. I will give the eyewitness account of several examples and their lessons learned. I will also discuss important directions for future research.

7.8 Wolf Singer

- Max Planck Institute for Brain Research (MPI), Ernst Strüngmann Institute (ESI) for Neuroscience in Cooperation with Max Planck Society Frankfurt am Main, Germany
- Title: Computing in the high dimensional state space provided by delayed coupled recurrent networks.
- It is proposed that the evolution of cortical structures in the vertebrate brain (neocortex and hippocampus) introduced novel computational principles that complement those realized in multi-layered feed-forward networks. A hall mark of cortical architectures is recurrence, the dense and reciprocal coupling among distributed feature specific neurons. Such networks engage in high dimensional non-linear dynamics exhibiting oscillatory activity in widely differing frequency ranges and complex correlation structures. Analysis of massive parallel recordings of neuronal responses in cat and monkey visual cortex suggests that the cerebral cortex exploits the high dimensional dynamic space offered by recurrent networks for the encoding, classification and storage of information. Evidence is presented that the recurrent connections among cortical neurons are susceptible to activity dependent modifications of their synaptic gain, which allows the network to store priors about the statistical contingencies of the outer world. Matching of sensory evidence with stored priors is associated with fast transitions towards sub-states of reduced dimensionality that are well classifiable by linear classifiers. In addition the network dynamics allow for the superposition and fast read out of information about sequentially presented stimuli, facilitating the encoding and storage of information about sequences. It is proposed that computations in high dimensional state space can account for the ultra-fast integration of sensory evidence with stored priors and the subsequent classification of the results of this matching operation.

7.9 Ichiro Tsuda

- Chubu University Academy of Emerging Sciences, Chubu University, Kasugai, Japan
- Title: A dynamical principle of functional differentiation: a mathematical point of view
- One of the most striking characteristics of the developing brain is the generation of functionally differentiated neural areas, while emerging interactions develop between networking areas, whereby the brain works as a whole. Functional differentiation is well known as, typically, Brodmann areas or as a functional map in that different areas represent different cognitive and behavioral functions. Recently, the functional parcellation of the human neocortex was observed by means of the functional connectivity of the dynamics involved in the corresponding neural networks, and was shown to consist of finer areas compared with the functional map. The presence of functional parcellation suggests that a self-organization of neural networks occurs rapidly, based on chaotic dynamics, under various constraints of behaviors. A similar self-organization of neural networks may also occur during the ontogenetic development of the brain under constraints, which may be stimulation by light and sound from the external environment or the physical pressure stemming from the individuals own skull. In this respect, we hypothesize the existence of a common principle of self-organization with constraints in both functional differentiation and functional parcellation.

To clarify the neural mechanism of functional differentiation, we constructed a mathematical model of self-organization with constraints. By casting different constraints, we investigated the mathematical structures embedded into the process of functional differentiation at various stages of neuronal development and obtained the following dynamic behaviors. We observed the genesis of a neuron-like dynamical system in the developmental process of coupled dynamical systems. We found the genesis of neuron-like units that respond specifically to sensory stimuli. We also detected the genesis of functional modules from randomly uniform networks of oscillations, where one module can be interpreted as a "higher" level (such as a cognitive area) and the other can be interpreted as a "lower" level (such as a motor area interacting with the body). In all cases, the appearance of chaos and chaotic itinerancy in the whole network plays an essential role in the generation of functional elements.

The differentiation of both sensorimotor systems and memory systems is decisive for brain development. In this respect, we studied the neural networks of memory, and its dynamics. We found chaotic transitions between memories that were dynamically represented by attractors by introducing inhibitory neurons into the recurrent networks of excitatory neurons. In this situation, the transitions between attractors were described by chaotic itinerancy. This finding allowed the study of the dynamics of episodic memory formation in the hippocampus. We proposed a Cantor coding hypothesis, which was partially substantiated using hippocampal slices from rats. In my talk, I will first describe a theoretical framework of self-organization with constraints and compare it with conventional theories of self-organization. Next, I will deal with mathematical models at various levels of differentiation. Finally, I will discuss the memory system and its dynamics.

- Panel 1 Abstract:
This panel addresses novel avenues to support neural network research. Representatives of funding agencies and leading experts in the field will describe research challenges and funding opportunities. Which cutting edge areas are at the focus of new funding initiatives? The panel will provide a forum for thorough discussions on these topics between the panelists. It is expected to have an intensive questions and answers section with the audience.

8.2 Panel 2: NSF Career Award Winners in Intelligent and Adaptive Systems

- Panel Co-Chairs: Anthony Kuh, NSF; Robi Polikar, Rowan University; Haibo He, University of Rhode Island
Moderator: Anthony Kuh, NSF
Panelists: Yiran Chen, Duke University; Silvia Ferrari, Cornell University; Haibo He, University of Rhode Island; Robi Polikar, Rowan University
- Panel 2 Abstract:
This panel will feature past NSF Career Award winners that received awards from the National Science Foundation (NSF) in the Electrical, Communications, and Cyber Systems Division in the Intelligent and Adaptive Systems Area. The panel will take approximately two hours. First the panelists will give short presentations (10-12 minutes apiece) about what they did for their NSF Career Award and how it advanced their careers. This will be followed by a question and answer session with the audience (40- 60 minutes). We anticipate having 5 to 6 past NSF Career Award winners. We have listed four confirmed panelists.

There are currently many lucrative career opportunities for researchers in AI, data science and machine learning in large companies (e.g. Amazon, Google, Facebook, Apple, Microsoft) and also in numerous startup firms. We want to showcase successful academic careers. We will have former NSF Career Award winners in intelligent and adaptive systems discuss their NSF Career Awards and how it helped them launch their academic careers. This should be of great interest to all participants, but especially to junior faculty, postdocs, and graduate students. There will be significant time for questions and answers so that the audience can ask panelists questions ranging from how the panelists got their NSF Career award (including tips for writing proposals) to how they used their Career Award to achieve success in research and academia.

8.3 Panel 3: Deep Learning: Hype or Hallelujah?

- Panel Chair: Vladimir Cherkassky, University of Minnesota, USA
Panelists: in progress
- Panel 3 Abstract:
In the last 3-5 years there have been tremendous interest in the so-called Deep Learning Networks (DLN). Unfortunately, there is little theoretical understanding of DLNs and many claims about their superior capabilities often represent technical marketing. These are 3 main types of arguments made by supporters of DLNs: (1) automatic feature selection by DLNs; (2) biological flavor of DLN learning; (3) their competitive generalization performance on several large real-life application data sets, such as image recognition, etc. One may adopt more cautious and skeptical viewpoint about DLNs arguing that:

There is no theoretical reason for DLNs to perform better than other methods. So their superior performance (on some application data) is simply due to good match between statistical characteristics of the data at hand and DLN parameterization. All existing empirical results using DLN on large data sets effectively implement Empirical Risk Minimization (ERM) inductive principle (under VC-theoretical framework). In spite of all hype and publicity, there have been no systematic empirical comparison studies using synthetic data sets under (under small size setting). Claims about biological motivation behind DL are rather naive (especially since such claims are made by computer scientists and engineers, not neuroscientists). The panel will present opposing views on DL, followed by questions from the

audience. The panel starts with a critical view by panel chair, continues with responses from panelists, some follow up questions, and questions from the audience.

9.1 C01 : Challenge UP: Multimodal Fall Detection

- Hiram Ponce, Lourdes Martínez-Villaseñor, León Palafox, Karina Pérez
- Falls are frequent especially among old people and it is a major health problem according to World Health Organization. Fall detectors can alleviate this problem and can reduce the time in which a person who suffered a fall receives assistance. Recently, there has been an increase in fall detection system development based mainly in sensor and/or context approaches; however, public datasets are difficult to access. In that sense, we provide a public multimodal dataset for fall detection in the benefit of researchers in the fields of wearable computing, ambient intelligence, and vision. In the best of our knowledge, no fall detection competition has been reported, and especially using a multimodal dataset. Contact: hponce@up.edu.mx

11 Workshops

11.1 Workshop 1 : Advances in Learning from/with Multiple Learners (ALML)

- Organizers: Nistor Grozavu, Paris 13 University, Razvan Andonie, Central Washington, Parisa Rastin, Paris 13 University, Nicoleta Rogovschi, University Paris Descartes, Basarab Matei, Paris 13 University, Guénaél Cabanes, Paris 13 University
- Details: This workshop will cover original and pioneering contributions, theory as well as applications on creating and combining learning models, and aim at an inspiring discussion on the recent progress and the future developments. Learners based on different paradigms can be combined for improved accuracy. Each learning method presupposes some model of the world that comes with a set of assumptions which may lead to error if they do not hold. Learning is an ill-posed problem and with finite data each algorithm converges to a different solution and fails under various circumstances. In learning models combinations, it is possible to make a distinction between two main modes: ensemble and modular. For an ensemble approach, several solutions to the same task, or task component, are combined to yield a more reliable estimate. In the modular approach, particular aspects of a task are dealt with by specialist components before being recombined to form a global solution. In this workshop, the reasons for combining learning models and the main methods for creating and combining them will be presented. Also, the effectiveness of these methods will be discussed considering the concepts of diversity and selection of these approaches. The workshop will strive to bring together the practitioners of these approaches in an attempt to study a unified framework under which these interactions can be studied, understood, and formalized. The following is a partial list of relevant topics (not limited to) for the workshop:
 - Hyper
 - parameters optimization
 - Bagging approaches
 - Boosting techniques
 - Collaborative clustering
 - Collaborative learning
 - Cooperative learning
 - Ensemble methods
 - Hybrid systems
 - Mixtures of distributions
 - Mixtures of experts
 - Modular approaches

 - Task decomposition
 - Transfer learning with multiple sources
 - Learning from data streams
 - Data aggregation

11.2 Workshop 2 : Computational Sport Science: Human Motion Modelling and Analysis

- Organizers: Boris Bačić, Auckland University of Technology, New Zealand
- Details: Pushing the boundaries of computational intelligence also means embracing sport science to advance and augment the ways in which we experience movement activity, rehabilitation exercises as well as how sport is coached, played, promoted, broadcasted, and commercialised. Although many sport cameras, mobile apps and wearable computing devices typically exchange data and process user activity on their cloud infrastructures, it is still possible for academics and small-to-large companies to engage in research based on motion data processing. As an addition to the nascent area of sport analytics, computational sport science is focused on data-driven machine-learning approaches and human motion modelling and analysis (HMMA). Computational sport science has the potential to provide diagnostic capability and insights from data, find patterns in specific contexts, generate

knowledge, validate experts' common-sense rules, offload support decisions, and automate cognitive activities. The research and development that is to be presented, regarding next-generation augmented coaching systems and technology (ACST), is targeted at improving quality of life associated with our ability to move and related contexts such as performance, safety, response times, general motor skills, and sport-specific technique. This workshop will also provide insights and the opportunity for attendees to engage in research that is aimed at creating strategic differences in elite sports and developing sports gadgets, exergames, and rehabilitation technologies. Linked to IJCNN 2019, authors interested in extending their conference or workshop proceeding papers to a journal, are invited to submit their work free of charge to open-access MDPI Journal Information, Special Issue on Computational Sport Science and Sport Analytics, by 30th of December 2019.

11.3 Workshop 3 : Ethical AI Challenges

- Organizers: Nigel Crook, Rebecca Raper, Matthias Rolf, Chrisina Jayne, Oxford Brookes University, UK
- Details: The workshop will be the 1st annual workshop on Ethical AI Challenges and will be a chance for researchers working within the field of Ethical AI to share recent research and discuss contemporary issues. Contributions will be invited from a diverse range of interdisciplinary fields, included, but not limited to, neural networks, machine learning, machine ethics, philosophy of ethics, developmental psychology and cognitive science. The workshop will be a half day, and will have the format of invited presentations followed by discussions. The key objectives of the workshop will be the following:
 - Introduce different challenges in Ethical AI to a broad audience
 - Receive opinion on Ethical AI challenges from an interdisciplinary group
 - Combine expertise to solve contemporary challenges
 - Propose future direction for research in the field

The workshop relates to the IJCNN because it involves challenges posing many neural network specialists. Ethics is at the forefront of much neural network research, and there is a requirement for future AI to be designed ethically. Neural network techniques have also been applied in attempting to create autonomous ethical AI. Contributors will be invited, after the workshop, to submit a paper for a special edition journal centred on Ethical AI. The journal issue will be a showcase of contemporary challenges within Ethical AI.

The ethics of artificial intelligence is becoming an increasingly important area within the discipline of computer science and machine learning. As computers become ever so increasingly complex, and algorithms more powerful and sophisticated, there is a requirement for these systems to have greater ethical governance. Ethical AI is a broad discipline that covers data ethics, ethical management of systems and autonomous moral machines. It has become ever more important that experts within neural networks understand this area. As an emerging field, there are opportunities for experts working in this area to share ideas and collaborate.

The target audience will be academics and researchers working in any area related to ethical AI, or with an interest in ethical issues surrounding AI. The estimated number of presenters will be 2, followed by breakout activity and group presentations. Expected number of attendees is 30.

11.4 Workshop 4 : Casualty and Dynamics in Brain Networks

- Organizers: András Telcs, Wigner Research Centre for Physics, Zoltán Somogyvári, Wigner Research Centre for Physics, Vaibhav Diwadkar, Wayne State University, Lázló Négyessy, Wigner Research Centre for Physics
- Details:

Causality has been considered to be one, if not the most fundamental pillars underpinning scientific explanation. Yet, the investigation of causal relations is challenging, particularly so in extremely complex and highly dynamic systems like the human brain. Brain networks are organized at several levels, inter-related through complex signal propagation pathways. Determining functional information flow in such a labyrinthine system is an extremely difficult task because functional interactions transcend the relatively well-understood patterns of structural connectivity. In vivo measurement techniques continue to improve with advances in engineering and technology, and the field is increasingly awash in data. Yet, the computational power and the concepts and models needed to analyse and model data follows the exponential increase, roughly analogous to Moores Law. To be blunt, in the brain we still cannot answer the simple question: Does event A cause B, or vice versa, or does a non observed event C influence both of them? To bring these questions into focus and to present approaches toward the study of causality and dynamics,

The workshop will cover (but will not be limited to) the following topics:

- Analysis methods for brain dynamics
- Brain networks and interactions
- Causality analysis
- Structure, function and dynamics in the brain networks
- Information processing and dynamics of neural networks
- Measurements of neural interactions

Motivation and audience The workshop aims to bring together neurobiologists, experts of data analysis especially in the field of causality analysis and connectomic researchers with particular focus on dynamic interactions orchestrating the work of our brain. Neurobiologists are welcome to present not only their empirical results, but also to propose questions which may motivate new data analysis techniques.

Format and activities The workshop will consist of the presentations of several invited speakers, a set of contributed presentations, and a panel discussion around the presented works and open questions. Depending on the number of contributions, the workshop's duration would be from half a day to one day.

**IEEE World Congress on Computational Intelligence 19th - 24th July 2020
Glasgow, Scotland, UK [<http://wcci2020.org>]**

The IEEE World Congress on Computational Intelligence (IEEE WCCI) is the world's largest technical event in the field of computational intelligence. The IEEE WCCI 2020 will host three conferences: The 2020 International Joint Conference on Neural Networks (IJCNN 2020), the 2020 IEEE International Conference on Fuzzy Systems (FUZZ-IEEE 2020), and the 2020 IEEE Congress on Evolutionary Computation (IEEE CEC 2020) under one roof. It encourages cross-fertilisation of ideas among the three big areas and provides a forum for intellectuals from all over the world to discuss and present their research findings on computational intelligence.

IEEE WCCI 2020 will be held in Glasgow - one of Europe's most dynamic cultural capitals and the "world's friendliest city" - located in Scotland, "the most beautiful country in the world" [Rough Guides 2015, 2017]. Steeped in culture, rich in history and alive with an excitement visitors will sense as they walk through its elegant Victorian streets, squares, parks and gardens. The Conference is being hosted at the prestigious Scottish Event Campus (SEC), which was a key venue for the Glasgow Commonwealth Games 2014 [<https://www.sec.co.uk/>].

IJCNN is the flagship conference of the International Neural Network Society and the IEEE Computational Intelligence Society. It covers a wide range of topics in the field of neural networks, from biological neural network modelling to artificial neural computation.

FUZZ-IEEE is the foremost conference in the field of fuzzy systems. It covers all topics in fuzzy systems, from theory to applications.

IEEE CEC is the leading event in the field of evolutionary computation, and covers all topics in evolutionary computation from theory to applications.

Call for Papers

Electronic submission of papers for IEEE WCCI 2020 will be required through the Congress website at www.wcci2020.org. All papers will be refereed by experts in the fields and ranked based on the criteria of originality, significance, quality and clarity. See Important Dates above.

Call for Tutorials

IEEE WCCI 2020 will solicit proposals for tutorials offering a unique opportunity to disseminate in-depth information on specific topics in computational intelligence. Tutorials will be organized by scientists or professionals who have significant expertise in the selected topic and whose recent work has had a significant impact in their field. For enquiries, please contact the Tutorials Co-Chair most appropriate to your topic.

Call for Special Sessions

IEEE WCCI 2020 will solicit proposals for Special Sessions within the technical scope of the three conferences. Special Sessions are expected to be organised by internationally recognised experts, with aims to bring together researchers in special focused topics. Cross-fertilisation of the three technical disciplines and newly emerging research areas are strongly encouraged. Inquiries should be addressed to the Special Session co-Chair most appropriate to your topic.

Call for Workshops

IEEE WCCI 2020 will solicit proposals for half or full-day workshops to provide participants with the opportunity to present and discuss novel research ideas on active and emerging CI topics, challenging problems and/or industrial applications. Workshop organizers are encouraged to make their workshops highly interactive, and include discussions, Q&A and panel sessions to facilitate a lively exchange of ideas among the attendees. Inquiries regarding should be addressed to the Workshops Chairs.

Call for Competitions

IEEE WCCI 2020 will host competitions to stimulate research in computational intelligence. A competition proposal should include descriptions of the problem(s) addressed, evaluation procedures, and a biography of the organisers. Inquiries regarding competitions should be addressed to the Competitions Chairs.
